III - Stability theorem

Bottleneck distance

4/11 (1/12)

Consider two barcodes P and Q , that is, multisets of intervals $\{(a_i, b_i), i \in \mathcal{I}\}$ of $(\overline{\mathbb{R}^+})^2$ such that $a_i \leq b_i$ for all $i \in \mathcal{I}$.

Consider two barcodes P and Q , that is, multisets of intervals $\{(a_i, b_i), i \in \mathcal{I}\}$ of $(\overline{\mathbb{R}^+})^2$ such that $a_i \leq b_i$ for all $i \in \mathcal{I}$.

A **partial matching** between the barcodes is a subset $M \subset P \times Q$ such that

- for every $p \in P$, there exists at most one $q \in Q$ such that $(p, q) \in M$,
- for every $q \in Q$, there exists at most one $p \in P$ such that $(p, q) \in M$.

The points $p \in P$ (resp. $q \in Q$) such that there exists $q \in Q$ (resp. $p \in P$) with $(p, q) \in M$ are said **matched** by M .

Consider two barcodes P and Q , that is, multisets of intervals $\{(a_i, b_i), i \in \mathcal{I}\}$ of $(\overline{\mathbb{R}^+})^2$ such that $a_i \leq b_i$ for all $i \in \mathcal{I}$.

Bottleneck distance

4/11 (5/12)

Consider two barcodes P and Q , that is, multisets of intervals $\{(a_i, b_i), i \in \mathcal{I}\}$ of $(\overline{\mathbb{R}^+})^2$ such that $a_i \leq b_i$ for all $i \in \mathcal{I}$.

A **partial matching** between the barcodes is a subset $M \subset P \times Q$ such that

- for every $p \in P$, there exists at most one $q \in Q$ such that $(p, q) \in M$,
- for every $q \in Q$, there exists at most one $p \in P$ such that $(p, q) \in M$.

The points $p \in P$ (resp. $q \in Q$) such that there exists $q \in Q$ (resp. $p \in P$) with $(p, q) \in M$ are said **matched** by M .

Bottleneck distance

4/11 (6/12)

Consider two barcodes P and Q , that is, multisets of intervals $\{(a_i, b_i), i \in \mathcal{I}\}$ of $(\overline{\mathbb{R}^+})^2$ such that $a_i \leq b_i$ for all $i \in \mathcal{I}$.

A **partial matching** between the barcodes is a subset $M \subset P \times Q$ such that

- for every $p \in P$, there exists at most one $q \in Q$ such that $(p, q) \in M$,
- for every $q \in Q$, there exists at most one $p \in P$ such that $(p, q) \in M$.

The points $p \in P$ (resp. $q \in Q$) such that there exists $q \in Q$ (resp. $p \in P$) with $(p, q) \in M$ are said **matched** by M .

If a point $p \in P$ (resp. $q \in Q$) is not matched by M , we consider that it is matched with the singleton $\bar{p} = [\frac{p_1+p_2}{2}, \frac{p_1+p_2}{2}]$ (resp. $\bar{q} = [\frac{q_1+q_2}{2}, \frac{q_1+q_2}{2}]$).

Consider two barcodes P and Q , that is, multisets of intervals $\{(a_i, b_i), i \in \mathcal{I}\}$ of $(\overline{\mathbb{R}^+})^2$ such that $a_i \leq b_i$ for all $i \in \mathcal{I}$.

A **partial matching** between the barcodes is a subset $M \subset P \times Q$ such that

- for every $p \in P$, there exists at most one $q \in Q$ such that $(p, q) \in M$,
- for every $q \in Q$, there exists at most one $p \in P$ such that $(p, q) \in M$.

The points $p \in P$ (resp. $q \in Q$) such that there exists $q \in Q$ (resp. $p \in P$) with $(p, q) \in M$ are said **matched** by M .

If a point $p \in P$ (resp. $q \in Q$) is not matched by M , we consider that it is matched with the singleton $\bar{p} = [\frac{p_1+p_2}{2}, \frac{p_1+p_2}{2}]$ (resp. $\bar{q} = [\frac{q_1+q_2}{2}, \frac{q_1+q_2}{2}]$).

The **cost** of a matched pair (p, q) (resp. (p, \bar{p}) , resp. (\bar{q}, q)) is the sup norm $\|p - q\|_\infty = \sup\{|p_1 - q_1|, |p_2 - q_2|\}$ (resp. $\|p - \bar{p}\|_\infty$, resp. $\|\bar{q} - q\|_\infty$).

The **cost** of the partial matching M , denoted $\text{cost}(M)$, is the supremum of all costs.

Bottleneck distance

4/11 (8/12)

Consider two barcodes P and Q , that is, multisets of intervals $\{(a_i, b_i), i \in \mathcal{I}\}$ of $(\overline{\mathbb{R}^+})^2$ such that $a_i \leq b_i$ for all $i \in \mathcal{I}$.

Definition: The *bottleneck distance* between P and Q is defined as the infimum of costs over all the partial matchings:

$$d_b(P, Q) = \inf\{\text{cost}(M), M \text{ is a partial matching between } P \text{ and } Q\}.$$

Bottleneck distance

4/11 (9/12)

Consider two barcodes P and Q , that is, multisets of intervals $\{(a_i, b_i), i \in \mathcal{I}\}$ of $(\overline{\mathbb{R}^+})^2$ such that $a_i \leq b_i$ for all $i \in \mathcal{I}$.

Definition: The *bottleneck distance* between P and Q is defined as the infimum of costs over all the partial matchings:

$$d_b(P, Q) = \inf \{ \text{cost}(M), M \text{ is a partial matching between } P \text{ and } Q \}.$$

Consider two barcodes P and Q , that is, multisets of intervals $\{(a_i, b_i), i \in \mathcal{I}\}$ of $(\overline{\mathbb{R}^+})^2$ such that $a_i \leq b_i$ for all $i \in \mathcal{I}$.

Definition: The *bottleneck distance* between P and Q is defined as the infimum of costs over all the partial matchings:

$$d_b(P, Q) = \inf\{\text{cost}(M), M \text{ is a partial matching between } P \text{ and } Q\}.$$

If \mathbb{U} and \mathbb{V} are two decomposable persistence modules, we define their *bottleneck distance* as

$$d_b(\mathbb{U}, \mathbb{V}) = d_b(\text{Diagram}(\mathbb{U}), \text{Diagram}(\mathbb{V})).$$

Example: Let $a, a', b, b' \in \mathbb{R}^+$ such that $a \leq b$ and $a' \leq b'$. Define the barcodes $P = \{[a, b]\}$ and $Q = \{[a', b']\}$.

First, consider the empty matching $M = \emptyset$. The intervals are matched to their projection, and the cost is

$$\left| (a, b) - \left(\frac{a+b}{2}, \frac{a+b}{2} \right) \right|_{\infty} = \frac{b-a}{2}, \quad \left| (a', b') - \left(\frac{a'+b'}{2}, \frac{a'+b'}{2} \right) \right|_{\infty} = \frac{b'-a'}{2}$$

The total cost is $\text{cost}(M) = \max \left\{ \frac{b-a}{2}, \frac{b'-a'}{2} \right\}$.

Next, consider the matching $M' = \{((a, b), (a', b'))\}$. The intervals are matched together, and the cost of the pair is

$$|(a, b) - (a', b')|_{\infty} = \max\{|a - a'|, |b - b'|\}.$$

which is also $\text{cost}(M')$.

These are the only two partial matchings, and we deduce the bottleneck distance

$$d_b(P, Q) = \min \left\{ \max \left\{ \frac{b-a}{2}, \frac{b'-a'}{2} \right\}, \max\{|a - a'|, |b - b'|\} \right\}.$$

Example: Let $a, a', b, b' \in \mathbb{R}^+$ such that $a \leq b$ and $a' \leq b'$. Define the barcodes $P = \{[a, b]\}$ and $Q = \{[a', b']\}$. We have

$$d_b(P, Q) = \min \left\{ \max \left\{ \frac{b-a}{2}, \frac{b'-a'}{2} \right\}, \max\{|a-a'|, |b-b'|\} \right\}.$$

Example: Let $a, a', b, b' \in \mathbb{R}^+$ such that $a \leq b$ and $a' \leq b'$. Consider the interval-modules $\mathbb{B}[a, b]$ and $\mathbb{B}[a', b']$.

Their barcodes are the sets P and Q of the previous example, from which we deduce

$$d_b(\mathbb{B}[a, b], \mathbb{B}[a', b']) = \min \left\{ \max \left\{ \frac{b-a}{2}, \frac{b'-a'}{2} \right\}, \max\{|a-a'|, |b-b'|\} \right\}.$$

Interleaving distance

5/11 (1/12)

Consider two persistence modules \mathbb{V} and \mathbb{W} :

$$\begin{array}{ccccccc} \text{-----} \rightarrow & V^{t_1} & \xrightarrow{v_{t_1}^{t_2}} & V^{t_2} & \xrightarrow{v_{t_2}^{t_3}} & V^{t_3} & \xrightarrow{v_{t_3}^{t_4}} & V^{t_4} & \text{-----} \\ & & & & & & & & \\ \text{-----} \rightarrow & W^{t_1} & \xrightarrow{w_{t_1}^{t_2}} & W^{t_2} & \xrightarrow{w_{t_2}^{t_3}} & W^{t_3} & \xrightarrow{w_{t_3}^{t_4}} & W^{t_4} & \text{-----} \end{array}$$

Given $\epsilon \geq 0$, an ϵ -**morphism** between \mathbb{V} and \mathbb{W} is a family of linear maps $\phi = (\phi_t: V^t \rightarrow W^{t+\epsilon})_{t \in \mathbb{R}^+}$ such that the following diagram commutes for every $s \leq t \in \mathbb{R}^+$:

$$\begin{array}{ccc} V^s & \xrightarrow{v_s^t} & V^t \\ \downarrow \phi_s & & \downarrow \phi_t \\ W^{s+\epsilon} & \xrightarrow{w_{s+\epsilon}^{t+\epsilon}} & W^{t+\epsilon} \end{array}$$

Interleaving distance

5/11 (2/12)

Consider two persistence modules \mathbb{V} and \mathbb{W} :

$$\begin{array}{ccccccc} \cdots & \rightarrow & V^{t_1} & \xrightarrow{v_{t_1}^{t_2}} & V^{t_2} & \xrightarrow{v_{t_2}^{t_3}} & V^{t_3} & \xrightarrow{v_{t_3}^{t_4}} & V^{t_4} & \cdots \\ \cdots & \rightarrow & W^{t_1} & \xrightarrow{w_{t_1}^{t_2}} & W^{t_2} & \xrightarrow{w_{t_2}^{t_3}} & W^{t_3} & \xrightarrow{w_{t_3}^{t_4}} & W^{t_4} & \cdots \end{array}$$

Given $\epsilon \geq 0$, an ϵ -**morphism** between \mathbb{V} and \mathbb{W} is a family of linear maps $\phi = (\phi_t: V^t \rightarrow W^{t+\epsilon})_{t \in \mathbb{R}^+}$ such that the following diagram commutes for every $s \leq t \in \mathbb{R}^+$:

$$\begin{array}{ccc} V^s & \xrightarrow{v_s^t} & V^t \\ \downarrow \phi_s & & \downarrow \phi_t \\ W^{s+\epsilon} & \xrightarrow{w_{s+\epsilon}^{t+\epsilon}} & W^{t+\epsilon} \end{array}$$

An ϵ -**interleaving** between \mathbb{V} and \mathbb{W} is a pair of ϵ -morphisms $(\phi_t: V^t \rightarrow W^{t+\epsilon})_{t \in \mathbb{R}^+}$ and $(\psi_t: W^t \rightarrow V^{t+\epsilon})_{t \in \mathbb{R}^+}$ such that the following diagrams commute for every $t \in \mathbb{R}^+$:

$$\begin{array}{ccc} V^t & \xrightarrow{v_t^{t+2\epsilon}} & V^{t+2\epsilon} \\ & \searrow \phi_t & \nearrow \psi_{t+\epsilon} \\ & W^{t+\epsilon} & \end{array}$$

$$\begin{array}{ccc} & V^{t+\epsilon} & \\ \nearrow \psi_t & & \searrow \phi_{t+\epsilon} \\ W^t & \xrightarrow{w_t^{t+2\epsilon}} & W^{t+2\epsilon} \end{array}$$

Interleaving distance

5/11 (3/12)

Consider two persistence modules \mathbb{V} and \mathbb{W} :

$$\begin{array}{ccccccc} \cdots & \rightarrow & V^{t_1} & \xrightarrow{v_{t_1}^{t_2}} & V^{t_2} & \xrightarrow{v_{t_2}^{t_3}} & V^{t_3} & \xrightarrow{v_{t_3}^{t_4}} & V^{t_4} & \cdots \\ \cdots & \rightarrow & W^{t_1} & \xrightarrow{w_{t_1}^{t_2}} & W^{t_2} & \xrightarrow{w_{t_2}^{t_3}} & W^{t_3} & \xrightarrow{w_{t_3}^{t_4}} & W^{t_4} & \cdots \end{array}$$

Given $\epsilon \geq 0$, an ϵ -**morphism** between \mathbb{V} and \mathbb{W} is a family of linear maps $\phi = (\phi_t: V^t \rightarrow W^{t+\epsilon})_{t \in \mathbb{R}^+}$ such that the following diagram commutes for every $s \leq t \in \mathbb{R}^+$:

$$\begin{array}{ccc} V^s & \xrightarrow{v_s^t} & V^t \\ \downarrow \phi_s & & \downarrow \phi_t \\ W^{s+\epsilon} & \xrightarrow{w_{s+\epsilon}^{t+\epsilon}} & W^{t+\epsilon} \end{array}$$

An ϵ -**interleaving** between \mathbb{V} and \mathbb{W} is a pair of ϵ -morphisms $(\phi_t: V^t \rightarrow W^{t+\epsilon})_{t \in \mathbb{R}^+}$ and $(\psi_t: W^t \rightarrow V^{t+\epsilon})_{t \in \mathbb{R}^+}$ such that the following diagrams commute for every $t \in \mathbb{R}^+$:

$$\begin{array}{ccc} V^t & \xrightarrow{v_t^{t+2\epsilon}} & V^{t+2\epsilon} \\ & \searrow \phi_t & \nearrow \psi_{t+\epsilon} \\ & W^{t+\epsilon} & \end{array} \quad \begin{array}{ccc} & V^{t+\epsilon} & \\ \nearrow \psi_t & & \searrow \phi_{t+\epsilon} \\ W^t & \xrightarrow{w_t^{t+2\epsilon}} & W^{t+2\epsilon} \end{array}$$

The **interleaving distance** is: $d_i(\mathbb{V}, \mathbb{W}) = \inf\{\epsilon \geq 0, \mathbb{V} \text{ and } \mathbb{W} \text{ are } \epsilon\text{-interleaved}\}.$

Interleaving distance

5/11 (4/12)

Example: Let $a, a', b, b' \in \mathbb{R}^+$ such that $a \leq b$ and $a' \leq b'$. Consider the interval-modules $\mathbb{B}[a, b]$ and $\mathbb{B}[a', b']$.

Let us find an ϵ -interleaving.

Interleaving distance

5/11 (5/12)

Example: Let $a, a', b, b' \in \mathbb{R}^+$ such that $a \leq b$ and $a' \leq b'$. Consider the interval-modules $\mathbb{B}[a, b]$ and $\mathbb{B}[a', b']$.

Let us find an ϵ -interleaving.

Given $\epsilon \geq 0$, an ϵ -**morphism** between \mathbb{V} and \mathbb{W} is a family of linear maps $\phi = (\phi_t: V^t \rightarrow W^{t+\epsilon})_{t \in \mathbb{R}^+}$ such that the following diagram commutes for every $s \leq t \in \mathbb{R}^+$:

$$\begin{array}{ccc} V^s & \xrightarrow{v_s^t} & V^t \\ \downarrow \phi_s & & \downarrow \phi_t \\ W^{s+\epsilon} & \xrightarrow{w_{s+\epsilon}^{t+\epsilon}} & W^{t+\epsilon} \end{array}$$

Interleaving distance

$$\begin{array}{ccc} V^s & \xrightarrow{v_s^t} & V^t \\ \downarrow \phi_s & & \downarrow \phi_t \\ W^{s+\epsilon} & \xrightarrow{w_{s+\epsilon}^{t+\epsilon}} & W^{t+\epsilon} \end{array}$$

————→ Only two possibilities for ϕ :

- always the zero map
- always nonzero when V^t and $W^{t+\epsilon}$ are nonzero

Interleaving distance

5/11 (9/12)

Example: Let $a, a', b, b' \in \mathbb{R}^+$ such that $a \leq b$ and $a' \leq b'$. Consider the interval-modules $\mathbb{B}[a, b]$ and $\mathbb{B}[a', b']$.

Let us find an ϵ -interleaving.

An ϵ -**interleaving** between \mathbb{V} and \mathbb{W} is a pair of ϵ -morphisms $(\phi_t: V^t \rightarrow W^{t+\epsilon})_{t \in \mathbb{R}^+}$ and $(\psi_t: W^t \rightarrow V^{t+\epsilon})_{t \in \mathbb{R}^+}$ such that the following diagrams commute for every $t \in \mathbb{R}^+$:

$$\begin{array}{ccc} V^t & \xrightarrow{v_t^{t+2\epsilon}} & V^{t+2\epsilon} \\ & \searrow \phi_t & \nearrow \psi_{t+\epsilon} \\ & W^{t+\epsilon} & \end{array}$$

$$\begin{array}{ccc} & V^{t+\epsilon} & \\ \psi_t \nearrow & & \searrow \phi_{t+\epsilon} \\ W^t & \xrightarrow{w_t^{t+2\epsilon}} & W^{t+2\epsilon} \end{array}$$

→ $\psi_{t+\epsilon} \circ \phi_t$ must be nonzero when $[t, t + \epsilon] \subset [a, b]$

Interleaving distance

5/11 (10/12)

Example: Let $a, a', b, b' \in \mathbb{R}^+$ such that $a \leq b$ and $a' \leq b'$. Consider the interval-modules $\mathbb{B}[a, b]$ and $\mathbb{B}[a', b']$.

Let us find an ϵ -interleaving.

An ϵ -**interleaving** between \mathbb{V} and \mathbb{W} is a pair of ϵ -morphisms $(\phi_t: V^t \rightarrow W^{t+\epsilon})_{t \in \mathbb{R}^+}$ and $(\psi_t: W^t \rightarrow V^{t+\epsilon})_{t \in \mathbb{R}^+}$ such that the following diagrams commute for every $t \in \mathbb{R}^+$:

$$\begin{array}{ccc} V^t & \xrightarrow{v_t^{t+2\epsilon}} & V^{t+2\epsilon} \\ & \searrow \phi_t & \nearrow \psi_{t+\epsilon} \\ & W^{t+\epsilon} & \end{array}$$

$$\begin{array}{ccc} & V^{t+\epsilon} & \\ \psi_t \nearrow & & \searrow \phi_{t+\epsilon} \\ W^t & \xrightarrow{w_t^{t+2\epsilon}} & W^{t+2\epsilon} \end{array}$$

—————→ $\psi_{t+\epsilon} \circ \phi_t$ must be nonzero when $[t, t + \epsilon] \subset [a, b]$

Interleaving distance

5/11 (11/12)

Example: Let $a, a', b, b' \in \mathbb{R}^+$ such that $a \leq b$ and $a' \leq b'$. Consider the interval-modules $\mathbb{B}[a, b]$ and $\mathbb{B}[a', b']$.

Let us find an ϵ -interleaving.

An ϵ -**interleaving** between \mathbb{V} and \mathbb{W} is a pair of ϵ -morphisms $(\phi_t: V^t \rightarrow W^{t+\epsilon})_{t \in \mathbb{R}^+}$ and $(\psi_t: W^t \rightarrow V^{t+\epsilon})_{t \in \mathbb{R}^+}$ such that the following diagrams commute for every $t \in \mathbb{R}^+$:

$$\begin{array}{ccc} V^t & \xrightarrow{v_t^{t+2\epsilon}} & V^{t+2\epsilon} \\ & \searrow \phi_t & \nearrow \psi_{t+\epsilon} \\ & W^{t+\epsilon} & \end{array}$$

$$\begin{array}{ccc} & V^{t+\epsilon} & \\ \psi_t \nearrow & & \searrow \phi_{t+\epsilon} \\ W^t & \xrightarrow{w_t^{t+2\epsilon}} & W^{t+2\epsilon} \end{array}$$

→ $\psi_{t+\epsilon} \circ \phi_t$ must be nonzero when $[t, t + \epsilon] \subset [a, b]$
 $\phi_{t+\epsilon} \circ \psi_t$ must be nonzero when $[t, t + \epsilon] \subset [a', b']$

Interleaving distance

5/11 (12/12)

Example: Let $a, a', b, b' \in \mathbb{R}^+$ such that $a \leq b$ and $a' \leq b'$. Consider the interval-modules $\mathbb{B}[a, b]$ and $\mathbb{B}[a', b']$.

Let us find an ϵ -interleaving.

→ Only two possibilities for ϕ :

- always the zero map
- always nonzero when V^t and $W^{t+\epsilon}$ are nonzero

→ $\psi_{t+\epsilon} \circ \phi_t$ must be nonzero when $[t, t + \epsilon] \subset [a, b]$
 $\phi_{t+\epsilon} \circ \psi_t$ must be nonzero when $[t, t + \epsilon] \subset [a', b']$

We deduce that either

- $|a - b| \leq 2\epsilon$ and $|a' - b'| \leq 2\epsilon$, or
- $|a - a'| \leq \epsilon$ and $|b - b'| \leq \epsilon$

Conclusion: $d_i(\mathbb{B}[a, b], \mathbb{B}[a', b']) = \min \left\{ \max \left\{ \frac{b - a}{2}, \frac{b' - a'}{2} \right\}, \max\{|a - a'|, |b - b'|\} \right\}$

I - Distances between persistence modules

II - Isometry theorem

III - Stability theorem

Theorem (Chazal, de Silva, Glisse, Oudot, 2016): If the persistence modules \mathbb{U} and \mathbb{V} are interval-decomposable, then $d_i(\mathbb{U}, \mathbb{V}) = d_b(\mathbb{U}, \mathbb{V})$.

—————→ *Stability:* $d_i(\mathbb{U}, \mathbb{V}) \geq d_b(\mathbb{U}, \mathbb{V})$

Converse stability: $d_i(\mathbb{U}, \mathbb{V}) \leq d_b(\mathbb{U}, \mathbb{V})$

Isometry theorem

7/11 (2/3)

Theorem (Chazal, de Silva, Glisse, Oudot, 2016): If the persistence modules \mathbb{U} and \mathbb{V} are interval-decomposable, then $d_i(\mathbb{U}, \mathbb{V}) = d_b(\mathbb{U}, \mathbb{V})$.

Proof: Let us write the decomposition of the persistence modules in intervals:

$$\mathbb{V} \simeq \bigoplus_{I \in \mathcal{I}} \mathbb{B}[I] \qquad \mathbb{W} \simeq \bigoplus_{J \in \mathcal{J}} \mathbb{B}[J]$$

Suppose that we have a ϵ -partial matching $M \subset \mathcal{I} \times \mathcal{J}$. This gives a matching of some intervals (I, J) , where $I = (a, b)$ and $J = (a', b')$, such that $|a - a'| \leq \epsilon$ and $|b - b'| \leq \epsilon$.

We can build an ϵ -interleaving between $\mathbb{B}[I]$ and $\mathbb{B}[J]$, that we denote $(\phi_{(I,J)}, \psi_{(I,J)})$.

Some intervals I (resp. J) are not matched, in which case their length is not greater than 2ϵ , and we can build an ϵ -interleaving with the zero persistence module. We denote this interleaving $(\phi_{(I,0)}, \psi_{(I,0)})$ (resp. $(\phi_{(0,J)}, \psi_{(0,J)})$).

Now, let us consider the sums of all these linear maps:

$$\bar{\phi} = \bigoplus_{(I,J) \text{ matched}} \phi_{(I,J)} \quad \bigoplus_{I \text{ not matched}} \phi_{(I,0)}, \qquad \bar{\psi} = \bigoplus_{(I,J) \text{ matched}} \psi_{(I,J)} \quad \bigoplus_{J \text{ not matched}} \psi_{(0,J)}$$

$\longrightarrow (\bar{\phi}, \bar{\psi})$ is an ϵ -interleaving $\longrightarrow d_i(\mathbb{U}, \mathbb{V}) \leq d_b(\mathbb{U}, \mathbb{V})$

Theorem (Chazal, de Silva, Glisse, Oudot, 2016): If the persistence modules \mathbb{U} and \mathbb{V} are interval-decomposable, then $d_i(\mathbb{U}, \mathbb{V}) = d_b(\mathbb{U}, \mathbb{V})$.

—————→ *Stability:* $d_i(\mathbb{U}, \mathbb{V}) \geq d_b(\mathbb{U}, \mathbb{V})$

Converse stability: $d_i(\mathbb{U}, \mathbb{V}) \leq d_b(\mathbb{U}, \mathbb{V})$

The stability part is more difficult.

A first strategy uses the interpolation lemma, and concludes with the box lemma.

Interpolation lemma: If \mathbb{U} and \mathbb{V} are δ -interleaved, then there exists a family of persistence modules $(\mathbb{U}_t)_{t \in [0, \delta]}$ such that $\mathbb{U}_0 = \mathbb{U}$, $\mathbb{U}_\delta = \mathbb{V}$ and $d_i(\mathbb{U}_s, \mathbb{U}_t) \leq |s - t|$ for every $s, t \in [0, \delta]$.

Another proof builds an explicit partial matching from an interleaving (Bauer, Lesnick, 2013).

I - Distances between persistence modules

II - Isometry theorem

III - Stability theorem

Back to the thickenings

9/11 (1/8)

Let X and Y be two subsets of \mathbb{R}^n . Define $\epsilon = d_H(X, Y)$ (Hausdorff distance).

We have seen that $X \subset Y^\epsilon$ and $Y \subset X^\epsilon$. We even have that $X^t \subset Y^{t+\epsilon}$ and $Y^t \subset X^{t+\epsilon}$ for all $t \geq 0$.

By denoting j and k these inclusions, we have a commutative diagram

Back to the thickenings

9/11 (2/8)

Let X and Y be two subsets of \mathbb{R}^n . Define $\epsilon = d_H(X, Y)$ (Hausdorff distance).

We have seen that $X \subset Y^\epsilon$ and $Y \subset X^\epsilon$. We even have that $X^t \subset Y^{t+\epsilon}$ and $Y^t \subset X^{t+\epsilon}$ for all $t \geq 0$.

By denoting j and k these inclusions, we have a commutative diagram

$$\begin{array}{ccccccc}
 \cdots \rightarrow & X^t & \hookrightarrow & X^{t+2\epsilon} & \hookrightarrow & X^{t+4\epsilon} & \hookrightarrow \cdots \\
 & \searrow j_t & & \nearrow k_{t+\epsilon} & & \searrow j_{t+2\epsilon} & & \nearrow k_{t+3\epsilon} & & \searrow j_{t+4\epsilon} \\
 \cdots \rightarrow & Y^{t+\epsilon} & \hookrightarrow & Y^{t+3\epsilon} & \hookrightarrow & Y^{t+5\epsilon} & \hookrightarrow \cdots
 \end{array}$$

This also gives inclusions between Čech complexes:

$$\begin{array}{ccccccc}
 \check{\text{Cech}}^t(X) & \hookrightarrow & \check{\text{Cech}}^{t+2\epsilon}(X) & \hookrightarrow & \check{\text{Cech}}^{t+4\epsilon}(X) & \hookrightarrow \cdots \\
 & \searrow j_t & & \nearrow k_{t+\epsilon} & & \searrow j_{t+2\epsilon} & & \nearrow k_{t+3\epsilon} & & \searrow j_{t+4\epsilon} \\
 \cdots \rightarrow & \check{\text{Cech}}^{t+\epsilon}(Y) & \hookrightarrow & \check{\text{Cech}}^{t+3\epsilon}(Y) & \hookrightarrow & \check{\text{Cech}}^{t+5\epsilon}(Y) & \hookrightarrow \cdots
 \end{array}$$

Back to the thickenings

9/11 (3/8)

[...] This also gives inclusions between Čech complexes:

$$\begin{array}{ccccccc}
 \check{\text{Cech}}^t(X) & \hookrightarrow & \check{\text{Cech}}^{t+2\epsilon}(X) & \hookrightarrow & \check{\text{Cech}}^{t+4\epsilon}(X) & \hookrightarrow & \cdots \\
 \searrow j_t & & \nearrow k_{t+\epsilon} & & \searrow j_{t+2\epsilon} & & \nearrow k_{t+3\epsilon} \\
 & & \check{\text{Cech}}^{t+\epsilon}(Y) & \hookrightarrow & \check{\text{Cech}}^{t+3\epsilon}(Y) & \hookrightarrow & \check{\text{Cech}}^{t+5\epsilon}(Y) \\
 \cdots \hookrightarrow & & & & & &
 \end{array}$$

$\searrow j_{t+4\epsilon}$

Now, we apply the i^{th} homology functor.

$$\begin{array}{ccccccc}
 H_i(\check{\text{Cech}}^t(X)) & \longrightarrow & H_i(\check{\text{Cech}}^{t+2\epsilon}(X)) & \longrightarrow & H_i(\check{\text{Cech}}^{t+4\epsilon}(X)) & \longrightarrow & \cdots \\
 \searrow (j_t)_* & & \nearrow (k_{t+\epsilon})_* & & \searrow (j_{t+2\epsilon})_* & & \nearrow (k_{t+3\epsilon})_* \\
 & & H_i(\check{\text{Cech}}^{t+\epsilon}(Y)) & \longrightarrow & H_i(\check{\text{Cech}}^{t+3\epsilon}(Y)) & \longrightarrow & H_i(\check{\text{Cech}}^{t+5\epsilon}(Y)) \\
 \cdots \longrightarrow & & & & & &
 \end{array}$$

$\searrow (j_{t+4\epsilon})_*$

Back to the thickenings

9/11 (4/8)

[...]

Hence the persistence modules $\left(H_i(\check{\text{Cech}}^t(X))\right)_{t \geq 0}$ and $\left(H_i(\check{\text{Cech}}^t(Y))\right)_{t \geq 0}$ are ϵ -interleaved.

The diagram illustrates the interleaving of two persistence modules. It shows two persistence modules, $\left(H_i(\check{\text{Cech}}^t(X))\right)_{t \geq 0}$ and $\left(H_i(\check{\text{Cech}}^t(Y))\right)_{t \geq 0}$, which are ϵ -interleaved. An arrow labeled \mathbb{U} points from the first module to the second, and an arrow labeled \mathbb{V} points from the second module back to the first.

We use the isometry theorem: $d_b(\mathbb{U}, \mathbb{V}) = d_i(\mathbb{U}, \mathbb{V}) \leq \epsilon$.

[...]

\mathbb{U} \mathbb{V}

We use the isometry theorem: $d_b(\mathbb{U}, \mathbb{V}) = d_i(\mathbb{U}, \mathbb{V}) \leq \epsilon$.

Theorem (Cohen-Steiner, Edelsbrunner, Harer, 2015): Let X and Y be two subsets of \mathbb{R}^n . Consider their Čech (resp. Rips) filtrations, and the corresponding i^{th} homology persistence modules, \mathbb{U} and \mathbb{V} . Suppose that they are interval-decomposable. Then $d_b(\mathbb{U}, \mathbb{V}) \leq d_H(X, Y)$.

Summary

10/11 (1/2)

Summary

10/11 (2/2)

Conclusion

We interpreted topological noise as small bars in barcodes.

We defined a distance between barcodes that is not too sensitive to small bars.

We linked this distance with an algebraic-flavoured distance.

We deduced a satisfactory result of stability.

Homework: Exercise 53

Conclusion
